The solution to a fluid dynamics problem typically involves calculating various properties of the fluid, such as velocity, pressure, density, and temperature, as functions of space and time. It has several subdisciplines itself, including aerodynamics [4] [5] [6] [7] (the study of air and other gases in motion) and hydrodynamics [8] [9] (the study of liquids in motion).

Fluid mechanics - Wikipedia
A fluid is defined as a substance that continually deforms (flows) under an applied shear stress regardless of the magnitude of the applied stress. Whereas a solid can resist an applied force by static deformation. Deformation of a solid and a fluid exposed to an applied force. Liquids, gases, plasmas and, to some extent, plastic solids are ...
