## **CAVENDISH PROBLEMS IN CLASSICAL PHYSICS**

This is an excellent set of physics problems ranging from roughly senior level high school to second year university. They make you think; there's no room for laziness when you're trying to solve them. When I was at Cambridge these were used to test physics freshmen in supervisions; most people found them tough going.

Posts about Cavendish Problems written by telescope. Too busy today (again) for anything else so I'm going to resort (again) to the Cavendish Problems in Classical Physics. I think I'll eschew the multiple-choice format for this one, but will say that there is a small hint in the fact that the question is split into two parts: The Eiffel Tower is 300m high and is situated at a latitude 49 ...

Cavendish and the Value of G Isaac Newton's law of universal gravitation proposed that the gravitational attraction between any two objects is directly proportional to the product of their masses and inversely proportional to the square of the distance between their centers. In equation form, this is often expressed as follows:

## A. B. Pippard | Open Library

Henry Cavendish performed an experiment to find the density of the Earth. Other scientists used his experimental setup to determine the value of G. The setup consisted of a torsion balance to attract lead balls together, measuring the torque on a wire and then equating it to the gravitational force between the balls.
