Cervical spine surgery may be indicated for a variety of spinal neck problems. Generally, surgery may be performed for degenerative disorders, trauma or instability. These conditions may produce pressure on

the spinal cord or on the nerves coming from the spine.

## **Cervical Spine Surgery: An Overview**

Cervical spine surgery is generally performed on an elective basis to treat either:

Nerve/spinal cord impingement (decompression surgery) Spinal instability (fusion surgery). The two

procedures are often combined, as a decompression may destabilize the spine and create the need for a fusion to add stability.
