The time response of control system consists of two parts, Transient

response and steady state response. $C(t) = C_{tr}(t) + C_{ss}(t)$. Most of the control systems use time as its independent variable. Analysis of response means to see the variation of output with respect to time. The output of the system takes some finite time to reach to its final value.

PROCEDURE: 1. Switch ON the power supply, switches ON S1. Slowly increase control P1 so that AC servomotor starts rotating.

Connect DVM across DC motor sockets (red & black). Vary the speed of servomotor gradually and note the speed N rpm and corresponding back emf E_b across DC motor.

As automation and connected devices move from industry to commercial products and the home, an understanding of the design and implementation of control systems on hardware is essential. The lab progression that accompanies the Quanser Controls Board begins with a grounding in the basics of modeling and
