The mosquito is a vector for many parasites, including the protozoan known as Plasmodium, which causes malaria. Epiparasite. These feed on other parasites in a relationship known as hyperparasitism.

Parasites: Types, in humans, worms, and ectoparasites

Thus vector transmitted parasites exhibit complex life cycles involving interactions between humans, protozoa, and arthropods. The biology of vectors and their interactions with humans provide possible means for controlling the transmission of these diseases. Tsetse and African Trypanosomes Triatomines and Trypanosoma cruzi

Vectors of Protozoan Parasites

Vector-borne diseases are human illnesses caused by parasites, viruses and bacteria that are transmitted by vectors. Every year there are more than 700,000 deaths from diseases such as malaria, dengue, schistosomiasis, human African trypanosomiasis, leishmaniasis, Chagas disease, yellow fever, Japanese encephalitis and onchocerciasis.

The Anopheles mosquito, a vector for malaria, filariasis, and various arthropod-borne-viruses (arboviruses), inserts its delicate mouthpart under the skin and feeds on its host's blood. The parasites the mosquito carries are usually located in its salivary glands (used by mosquitoes to anaesthetise the host).
