Rotor Vibration Measurements Using Laser

Rotor vibration measurements are often highlighted as a major application of laser vibrometers due to their noncontact operation and inherent immunity to shaft runout. In such measurements, resolution of the individual axial and torsional vibration components is possible via particular arrangement of the laser beam (s).

Rotor Vibration Measurements Using Laser Doppler

The application to vibration measurements on rotors is the particular focus of this paper which includes, for the first time, a three-dimensional consideration of the incident point on the target and validation of the DC component of measured velocity leading to evaluation of the individual components of the small but inevitable misalignments between the rotor and optical axes.

Bending vibration measurement on rotors by laser vibrometry

The photo detector is connected to the storage oscilloscope and microvoltmeter to display and measure the output. Next an electric motor, whose rotor vibrations are to be detected and measured, is so introduced in the experimental set up that its rotor cuts the laser beam partially. Laser based optical sensor for vibration measurements ...

The measurement of translational vibration velocity (on nonrotating structures) with laser - Doppler velocimetry (LDV) is now a well-established experimental technique. The basic principle of LDV requires the detection of the Doppler frequency shift in the coherent light scattered from a moving object.

Rotor vibration measurement is a key part of both the development and condition monitoring of rotating machinery. Measurement of the vibration transmitted from the rotor into a non-rotating component is the most common arrangement but in many situations the ideal rotor vibration measurement would be one taken directly from the rotating component.
