the jawbone to the skull. It is a bilateral synovial articulation between the temporal bone of the skull above and the mandible below; it is from these bones that its name is derived. This joint is unique in that it is a bilateral joint...

Temporomandibular joint - Wikipedia

The two temporomandibular joints (TMJs) form the

bilateral articulation of the mandible with the cranium. Together with the neuromuscular system, the anatomy of the TMJ contributes to specific mandibular functions. Studying the TMJ exclusively on dry skulls may lead to erroneous conclusions regarding both mandibular function and joint biomechanics.
