Endodontics. Broken or fractured teeth are a common finding in veterinary practices. In most cases, broken teeth are caused by the significant biting force dogs can generate coupled with the items they chew. Objects that are notorious for breaking teeth include cow hooves, real bones, rocks, ice, and hard plastic bones. Cats, as well as dogs,...

Endodontics Root canal therapy is recommended for many reasons. For example, a fractured tooth with painful pulp exposure, or an abscessed, dead, or discolored tooth. In most cases, due to their strategic nature, the teeth that are chosen for root canal therapy are the canine teeth and the carnassial teeth (upper 4th premolar and lower 1st molar).

The field of Endodontics encompasses the range of treatments used to deal with exposed pulp tissues and teeth that have “died” and become insensitive. Every tooth has a hollow space at its centre called the pulp chamber. Within this chamber are the blood vessels and nerves which normally nourish the tooth and provide sensation.
