Aerospace engineering is the primary field of engineering concerned with the development of aircraft and spacecraft. It has two major and overlapping branches: aeronautical engineering and astronautical engineering. Avionics engineering is similar, but deals with the electronics side of aerospace engineering. "Aeronautical engineering" was the original term for the field.

The Aircraft Design Process. The design process for an aircraft can be seen as very similar to other engineering products. However, the complexity of an aircraft and the tight safety regulations required make it a very expensive and long process. The general process can be divided as shown below:

Aircraft Design Process Overview - EngineeringClicks
An aircraft is a vehicle or machine that is able to fly by gaining support from the air.It counters the force of gravity by using either static lift or by using the dynamic lift of an airfoil, or in a few cases the downward thrust from jet engines.Common examples of aircraft include airplanes, helicopters, airships (including blimps), gliders, paramotors, and hot air balloons.
