Definition: Analog and digital communications are the two types of data transmission system however several factors generate the difference between the two. The major difference between analog and digital communication lies in the signal being transmitted. In analog communication, the message signal is in analog form i.e., continuous time signal.

The book, though comprehensive, has been developed in a reader-friendly fashion by providing numerous pedagogical aids for the study of Communication Systems. The product has been designed as per the need of the student whose requirement is to gain apt knowledge as per the examinations. An important feature is that the book takes a balanced approach towards both Analog & Digital Communications.

The signal which represents this condition with an inclined line in the figure, is an Analog Signal. The communication based on analog signals and analog values is called as Analog Communication. Digital Signal. A signal which is discrete in nature or which is non-continuous in form can be termed as a Digital signal. This signal has individual values, denoted separately, which are not based on the previous values, as if they are derived at that particular instant of time.

Any signal that can be transmitted by analog means can be sent by digital means, with the only issue being the number of bits used in A/D conversion (how accurately do we need to represent signal amplitude). Images can be sent by analog means (commercial television), but better communication performance occurs when we use digital systems (HDTV).

A digital communication system is a communication system where the information signal sent from A to B can be fully described as a digital signal. For example, consider Figure 1.6.Here, data is sent from one computer to another over a wire. The computer at point A is sending 0s or 1s to the computer at point B; a 0 is being represented by -5 V for a duration of time T and a 1 is being ...

In digital modulation, the modulation technique used is Pulse Code Modulation (PCM) where the analog signal is converted into digital form of 1s and 0s. As the resultant is a coded pulse train, this is called as PCM. This is further developed as Delta Modulation (DM).

The analog nature of electronic signals is of importance as the real world is analog, and because in modern microchips even digital circuits exhibit analog behaviour. Examples of engineering problems in analog electronics are: how to efficiently represent an analog signal such as an image recorded by a digital camera in a digital format so that it can be stored in a digital memory or processed by a microprocessor; how to send large amounts of information such as high-definition video data ...
