I am performing a simulation on roller bearing. I have a couple of doubts about it. 1. why the maximum stress value is coming lower in transient than in the static structural analysis. 2. why the effect of the load is not coming into the picture . 3. Is I have chosen the right module to solve this problem or I should try in Explicit dynamics

The basis of the bearing analysis is the CAD bearing model, in which the gap area is automatically detected. All information relevant for the operation, such as load, speed or lubricant data, is entered directly in Ansys Mechanical. The analysis of load capacity and friction can be done statically or transiently.
