Click chemistry, a term first coined by Kolb et al., described the goal to develop a set of powerful, selective, and modular building blocks, such as azide and alkyne, that work for both small and large scales. It is worth noting that the unactivated azide-alkyne cycloaddition was first discovered by Huisgen in 1963, but was ignored for decades primarily due to the requirements of high temperatures and pressures. Kolb et al. revitalized this reaction in 2001 by employing Cu(I) as a catalyst.
