Cohesive zone modeling with contact elements includes two different traction separation law forms: a bilinear traction separation law and an exponential traction separation law. Different variations of the bilinear material models are available, with each variation being activated by a different TBOPT value on the TB ,CZM command, as described in the following sections:

4.12. Cohesive Zone Material (CZM) Model

The cohesive zone must be discretized with a single layer of cohesive elements through the thickness. If the cohesive zone represents an adhesive material with a finite thickness, the continuum macroscopic properties of this material can be used directly for modeling the constitutive response of the cohesive zone.

Modeling with cohesive elements

The order of the nodes in defining the element is important. If the cohesive element bonds Element A to Element B, nodes 1-2-3-4 of the cohesive element should be shared by Element A or by Element B. In the first case, the normal of face 1-2-3-4 should point towards Element B and nodes 5-6-7-8 should be shared by Element B.
