6.4. Introduction to Time Series Analysis

Time series is a sequence of data points in chronological sequence, most often gathered in regular intervals. Time series analysis can be applied to any variable that changes over time and generally speaking, usually data points that are closer together are more similar than those further apart.

Time Index. A time series is a series of data points indexed in time order. In R, all data types for which an order is defined can be used to index a time series. If the operator $<$ is defined for a data type, then the data type can be used to index a time series.

Broadly speaking, a time series is said to be stationary if there is no systematic trend, no systematic change in variance, and if strictly periodic variations or seasonality do not exist. Most processes in nature appear to be non-stationary. Yet much of the theory in time-series literature is only applicable to
