Steps to bring CAD geometry of hot runner into Moldflow for analysis:
Combine the 3D CAD geometry of the DME gate-mate hot runner flow path and part into 1 single component. (See figure 1 below) Export the single component as a *.stp file. Import the single component into Moldflow under a new project in dual domain.

Model the hot runner system with curves. Identify the curves that represent the gates and apply to them the property Hot Gate. Select the hot gate curves that have valve gates associated with them, and add valve gate parameters. On meshing, the elements created along the curve adopt the Hot Gate beam property, to match the underlying curve.

Valve gates can only be used in conjunction with hot runners. There is no limit on the number of valve gates that can be assigned to a model. A valve gate must be assigned to a single hot gate element in each hot drop. For Gas-assisted Fill+Pack analysis, a valve gate

(PVC, POM) If so, the volume of material in the hot runner should be less than the shot volume. As a rule of thumb, the total Pressure in Moldflow (cavity + manifold) should be less than 10,000 psi. Moldflow can have 15% error and the machine barrel/nozzle can add an additional 3,000 - 5,000 psi to the analysis.
