Solution Colloid Suspension Characteristics

Colloids. Particles intermediate in size between those found in solutions and suspensions can be mixed in such a way that they remain evenly distributed without settling out. These particles range in size from 10^{-8} to 10^{-6} m in size and are termed colloidal particles or colloids.

Solutions, Suspensions, Colloids -- Summary Table

A colloid contains larger particles than particles in a solution. The particles are still too small to be easily seen, but are large enough to separate a light beam. Milk, fog, gelatin, mayonnaise, shaving cream, and whipped cream are examples of colloids.

WHAT ARE THE CHARACTERISTICS OF COLLOIDS ~ LORECENTRAL

The colloid is an intermediate case between the solution and the suspension because the diameter of colloid particles is in the range 1: 1000 nm, which is smaller than that of suspension (> 1000 nm) and larger than that of solution (< 1 nm).

The true solution is the homogenous mixture, while Colloidal solution and Suspension are the heterogeneous mixtures of two or more substances. Another difference between these three types of solution is that the True solution is transparent, while the Colloidal solution is translucent and Suspension is opaque.

Colloidal Solution is a heterogeneous mixture in which particle size of substance is intermediate of true solution and suspension i.e. between 1-1000 nm. Smoke from a fire is example of colloidal system in which tiny particles of solid float in air.

Colloidal Solution, True Solution and Suspension ...

The stability of a colloidal system is defined by particles remaining suspended in solution at equilibrium. Stability is hindered by aggregation and sedimentation phenomena, which are driven by the colloid's tendency to reduce surface energy. Reducing the interfacial tension will stabilize the colloidal system by reducing this driving force.
