These functions carry such names as Bessel functions, Laguerre functions, and the like. Most of the special functions encountered in such applications have a common root in their relation to the hypergeometric function. The purpose of this book is to establish this relationship and use it to obtain many of the interesting and important properties of the special functions met in applied mathematics.

But there is a corpus of mathematical information that we do need. Much of this consists of formulas for the "special" functions. How many of us remember the expansion of $\cos 5x$ in terms of $\cos x$ and $\sin x$, or whether an integral obtained in the course of a calculation can be identified as one of the many representations of a Bessel function, or whether the asymptotic expression for the ...

4 D. Zagier The modular group takes its name from the fact that the points of the quotient space $\Gamma \backslash \mathbb{H}$ are moduli (= parameters) for the isomorphism classes of elliptic curves over \mathbb{C} . To each point $z \in \mathbb{H}$ one can associate the lattice $\Lambda z = \mathbb{Z}z + \mathbb{Z}1 \subset \mathbb{C}$ and the quotient space $E z = \mathbb{C}/\Lambda z$, which is an elliptic curve, i.e., it is at the same time a complex curve and an abelian group.

Elliptic Modular Forms and Their Applications

In a 1996 meta-analysis based on 210 published data sets, APS Fellow David C. Rubin and psychological scientist Amy Wenzel concluded that the best mathematical fits were to the logarithmic function and the power function (plus two other unexpected and rarely used functions). Important exceptions to the forgetting curve also show replicability.
