In solid-state physics, a band gap, also called an energy gap, is an energy range in a solid where no electronic states can exist. In graphs of the electronic band structure of solids, the band gap generally refers to the energy difference (in electron volts) between the top of the valence band and the bottom of the conduction band in insulators and semiconductors.

This motion is different for each of the three states of matter. They are colliding with each other and the walls of their container. When the molecules collide with each other, or with the walls of a container, there is no significant loss of energy. ... Upper Saddle River, NJ: Pearson Prentice Hall. ISBN Number 0-13-149751-0.

Distinct phases may be described as different states of matter such as gas, liquid, solid, plasma or Bose-Einstein condensate.Useful mesophases between solid and liquid form other states of matter.. Distinct phases may also exist within a given state of matter. As shown in the diagram for iron alloys, several phases exist for both the solid and liquid states.
