A common dental surgery is tooth extraction, which is usually necessary to resolve disease, trauma or an overcrowded mouth. Teeth that are visible above the gumline and can be pulled with forceps are usually removed by a simple extraction. You may undergo a surgical extraction when bone or tissue must be cut to remove the tooth.

Jaw surgery, also known as orthognathic (or-thog-NATH-ik) surgery, corrects irregularities of the jaw bones and realigns the jaws and teeth to improve the way they work. Making these corrections may also improve your facial appearance. Jaw surgery may be a corrective option if you have jaw problems that can't be resolved with orthodontics alone.

## **Jaw surgery - Mayo Clinic**

If cancer has grown into the hard palate (front part of the roof of the mouth), all or part of the involved bone (maxilla) will need to be removed. This operation is called a maxillectomy or partial maxillectomy. The hole in the roof of the mouth this operation creates can be filled with a special denture called a prosthesis.
