CiteSeerX - Document Details (Isaac Councill, Lee Giles, Pradeep Teregowda): Abstract:- Visual Cryptography is a new Cryptography technique which is used to secure the images. In Visual Cryptography the Image is divided into parts called shares and then they are distributed to the participants. The Decryption side just stacking the share images gets the image.

At every step, the algorithm compares the each grayscale value of the current pixel  $J(i, j)$  by an integer between 0 and 255, to some threshold value is greater than the threshold value, the output pixel  $I(i, j)$  is considered black whose value is 0, else it is considered white whose value is 1.

Visual Cryptography based Grayscale Image Watermarking in DWT domain. Abstract: Watermarking is a technique to protect the copyrights of digital media like image, audio, video, etc. Visual Cryptography (VC) is a scheme for hiding information in still images. The Visual Cryptography Scheme splits the secret image into unintelligible images, these images are called shares.

Introduction This book comprehensively covers the important efforts in improving the quality of images in visual cryptography (VC), with a focus on cases with gray scale images. It not only covers schemes in traditional VC and extended VC for binary secret images, but also the latest development in the analysis-by-synthesis approach.

secret images can be restored by stacking operation. This property makes visual cryptography especially useful for the low computation load requirement. Iwamoto and Yamamoto in 2002, worked on an n-out-of-n visual secret sharing scheme for gray-scale images. They developed a secret sharing scheme that encodes gray-scale images

Two novel visual cryptography (VC) schemes are proposed by combining VC with single-pixel imaging (SPI) for the first time. It is pointed out that the overlapping of visual key images in VC is similar to the superposition of pixel intensities by a single-pixel detector in SPI. In the first scheme, QR-code VC is designed by using opaque sheets instead of transparent sheets.

In the process of Visual Cryptography a secret image is encrypted into shares which refuse to divulge information about the original secret image. Visual cryptographic solutions are based on binary or binaries inputs. Due to this, natural images must be first transformed into halftone (this is a technique which uses different density of dots to display the image) images to simulate the original gray or colour levels in the target binary image.
